## LISTING OF CLAIMS

This listing of claims will replace all prior versions of claims in the application:

- 1. (currently amended) A <u>process for making method for establishing</u> undifferentiated human, comprising the steps of:
  - (a) thawing a cryopreserved human blastocyst embryo; and
  - (b) removing trophectoderm from said embryo using anti-human lymphocyte antibody to isolate inner cell mass; and
- (c) culturing at least a portion of said human blastocyst embryo inner cell mass on a medium capable of sustaining undifferentiated embryonic stem cells, whereby undifferentiated human embryonic stem cells are established.
  - 2. (canceled)
- 3. (currently amended) The <u>process</u> method for establishing undifferentiated human embryonic stem cells of claim 1, wherein said human blastocyst embryo comprises a human embryo that was cryopreserved from about 5 days to about 6 days after fertilization of said embryo.
- 4. (currently amended) The <u>process</u> method for establishing undifferentiated human embryonic stem cells of claim 1, wherein said human blastocyst embryo has been cryogenically stored for more than four years.
- 5. (currently amended) The <u>process</u> method for establishing undifferentiated human embryonic stem cells of claim 1, wherein said thawing step comprises:
- (a) a first step of treating said cryopreserved human blastocyst embryo with a first solution comprising human follicular fluid and cryoprotectant;
- (b) a subsequent second step of treating said cryopreserved human blastocyst embryo with a second solution comprising human follicular fluid and cryoprotectant; wherein said second solution comprises a decreased concentration of cryoprotectant relative to said first solution.
- 6. (currently amended) The <u>process</u> method for establishing undifferentiated human embryonic stem cells of claim 5, wherein said cryoprotectant is selected from the group consisting of sucrose, glycerol and a combination of sucrose and glycerol.

Serial No.: 09/944,448

Filed: August 30, 2001

7. (currently amended) The <u>process</u> method for establishing undifferentiated human embryonic stem cells of claim 1, wherein said thawing step consists of:

- (a) a first step of treating said cryopreserved human blastocyst embryo with a first solution comprising human follicular fluid and cryoprotectant;
- (b) a subsequent second step of treating said cryopreserved human blastocyst embryo with a second solution comprising human follicular fluid and cryoprotectant;
- (c) a subsequent third step of treating said cryopreserved human blastocyst embryo with a third solution comprising hFF and cryoprotectant;
- (d) a subsequent fourth step of treating said cryopreserved human blastocyst embryo with a fourth solution comprising hFF and cryoprotectant; wherein said fourth solution comprises a decreased concentration of cryoprotectant relative to said third solution, said third solution comprises a decreased concentration of cryoprotectant relative to said second solution, and said second solution comprises a decreased concentration of cryoprotectant relative to said first solution.
- 8. (currently amended) The <u>process</u> method for establishing undifferentiated human embryonic stem cells of claim 5, further comprising a subsequent third step of treating said cryopreserved human blastocyst embryo with a third solution comprising hFF and cryoprotectant; wherein said third solution comprises about 0.1-2 vol % glycerol, said second solution comprises about 2-4 vol % glycerol, and said first solution comprises about 4-6 vol % glycerol.
- 9. (currently amended) The <u>process</u> method for establishing undifferentiated human embryonic stem cells of claim 5, wherein at least one of said treating steps is carried out for about 4-6 minutes.
- 10. (currently amended) The <u>process</u> method for establishing undifferentiated human embryonic stem cells of claim 5, wherein said first solution and said second solution each comprise about 15-25% human follicular fluid.
  - 11-12. (canceled)
- 13. (currently amended) An undifferentiated human embryonic stem cell culture formed using the method of any one of claims 1-12 process of any one of the preceding claims.

14. (currently amended) A <u>process for making method for establishing</u> undifferentiated human embryonic stem cells comprising the steps of:

- (a) obtaining at least two cryogenically stored human embryos, wherein said at least two embryos consist solely of embryos in the blastocyst phase;
- (b) thawing one or more of said at least two embryos; and
- (c) removing trophectoderm from said embryos using anti-human lymphocyte antibody to isolate inner cell mass; and
- (d) culturing at least a portion of each of said one or more thawed embryos inner cell mass on a medium capable of sustaining undifferentiated embryonic stem cells; whereby undifferentiated human embryonic stem cells are established.

## 15-31 (canceled)

- 32. (new) The process of claim 1, wherein the culturing step is carried out in the presence of mouse embryonic fibroblast STO cells.
- 33. (new) The process of claim 14, wherein the culturing step is carried out in the presence of mouse embryonic fibroblast STO cells.
